

3B1AM - LINEAR ALGEBRA & GRAPH THEORY

(CSE, IT, CSE(DS), CSE(AI&ML)) - April 2023

PART A - SHORT ANSWER QUESTIONS (2 Marks Each)

Q1: Define Rank of a matrix

Answer:

The rank of a matrix is the maximum number of linearly independent rows or columns in the matrix. It is denoted as $\text{rank}(A)$ or $r(A)$. For an $m \times n$ matrix, the rank is at most $\min(m, n)$. The rank can be found by reducing the matrix to its row echelon form (REF) or reduced row echelon form (RREF) and counting the number of non-zero rows.

Q2: Show that the system of linear equations $4x + 2y = 7$, $2x + y = 6$ has no solution

Answer:

Given system: $4x + 2y = 7$ and $2x + y = 6$

From the second equation: $2x + y = 6$, multiply by 2: $4x + 2y = 12$

But from the first equation: $4x + 2y = 7$

This gives us $7 = 12$, which is a contradiction. Therefore, the system has no solution (inconsistent).

Q3: If A is a square matrix of order 3×3 having eigenvalues 1, 2, -1, then find the trace of the matrix $B = A - A^{-1} + A^2$

Answer:

Given eigenvalues: $\lambda_1 = 1, \lambda_2 = 2, \lambda_3 = -1$

The trace of a matrix equals the sum of its eigenvalues.

$\text{Trace}(A) = 1 + 2 + (-1) = 2$

Eigenvalues of A^{-1} are: $1/1, 1/2, 1/(-1) = 1, 0.5, -1$

$\text{Trace}(A^{-1}) = 1 + 0.5 - 1 = 0.5$

Eigenvalues of A^2 are: $1^2, 2^2, (-1)^2 = 1, 4, 1$

$\text{Trace}(A^2) = 1 + 4 + 1 = 6$

Therefore, $\text{Trace}(B) = \text{Trace}(A) - \text{Trace}(A^{-1}) + \text{Trace}(A^2) = 2 - 0.5 + 6 = 7.5$

Q4: Find the nature of the Quadratic form $Q = x^2 + 2y^2 + 2z^2 - 2xy + 2xz - 2yz$

Answer:

The matrix form of the quadratic form is:

$$A = \begin{bmatrix} 1 & -1 & 1 \\ -1 & 2 & -1 \\ 1 & -1 & 2 \end{bmatrix}$$

Finding eigenvalues: The characteristic equation is $|A - \lambda I| = 0$

After calculation, eigenvalues are: $\lambda_1 = 0, \lambda_2 = 1, \lambda_3 = 4$

Since we have eigenvalues with 0, positive and negative values, the quadratic form is **Semi-definite positive**.

Q5: Define skew Hermitian matrix with an example

Answer:

A skew Hermitian matrix is a square matrix A such that $A^* = -A$, where A^* is the conjugate transpose of A.

Properties:

- Diagonal elements are purely imaginary or zero
- Off-diagonal elements satisfy: $a_{ij} = -\bar{a}_{ji}$

Example:

$$A = \begin{bmatrix} 0 & 2+i \\ -2+i & 0 \end{bmatrix}$$

Here, $A^* = -A$, so it is skew Hermitian.

Q6: Find the eigenvalues of the matrix $\begin{bmatrix} 1 & 1-3i \\ 1+3i & 7 \end{bmatrix}$

Answer:

Given matrix: $A = \begin{bmatrix} 1 & 1-3i \\ 1+3i & 7 \end{bmatrix}$

Characteristic equation: $|A - \lambda I| = 0$

$$(1-\lambda)(7-\lambda) - (1-3i)(1+3i) = 0$$

$$(1-\lambda)(7-\lambda) - (1-9) = 0$$

$$(1-\lambda)(7-\lambda) + 8 = 0$$

$$\lambda^2 - 8\lambda + 7 + 8 = 0$$

$$\lambda^2 - 8\lambda + 15 = 0$$

$$(\lambda - 3)(\lambda - 5) = 0$$

Eigenvalues: $\lambda_1 = 3, \lambda_2 = 5$

Q7: Define complete bipartite graph with example

Answer:

A complete bipartite graph $K_{\{m,n\}}$ is a bipartite graph where every vertex in one partition is connected to every vertex in the other partition.

Properties:

- Two sets of vertices with m and n vertices respectively
- Every vertex in set 1 is connected to all n vertices in set 2
- Total edges = $m \times n$

Example:

$K_{2,3}$ (Complete bipartite graph with 2 vertices in one partition and 3 in another):

- Vertices: A, B (partition 1) and X, Y, Z (partition 2)
 - Edges: AX, AY, AZ, BX, BY, BZ (total 6 edges)
-

Q8: Define planar graph with an example

Answer:

A planar graph is a graph that can be drawn on a plane such that no two edges cross each other (except at vertices).

Example:

A simple planar graph is the cycle graph C_5 (pentagon) which can be drawn without edge crossing.

Another example is K_4 (complete graph with 4 vertices):

```
1
/
2---3
| \ |
4---5
```

This can be drawn without crossings, making it planar.

Q9: Define Binary tree

Answer:

A binary tree is a rooted tree where each node has at most two children, called the left child and right child.

Properties:

- Maximum 2 children per node
- Can be empty
- Height of node is distance from node to deepest leaf
- Can be used to represent hierarchical data

Types:

- Full binary tree: Every node has either 0 or 2 children
- Complete binary tree: All levels filled except possibly last level

Q10: Write about pre-order traversal in trees

Answer:

Pre-order traversal is a depth-first tree traversal method where nodes are visited in the following order:

1. Visit the root node
2. Recursively traverse the left subtree
3. Recursively traverse the right subtree

Pseudo-code:

PreOrder(node):

if node is not null:

print(node.value)

PreOrder(node.left)

PreOrder(node.right)

Example: For tree with root A, left child B, right child C

- PreOrder: A, B, C

Applications: Creating a copy of the tree, getting prefix notation of an expression.

PART B - LONG ANSWER QUESTIONS (10 Marks Each)

Q11: Find the rank of the matrix by reducing to Normal form

Question:

Find the rank of the matrix by reducing to Normal form where:

$$A = \begin{bmatrix} 1 & 2 & 3 & -1 \\ 2 & 1 & 3 & 1 \\ 1 & 0 & 1 & 1 \\ 0 & 1 & 1 & 1 \end{bmatrix}$$

Answer:

Step 1: Apply row operations $R_2 \rightarrow R_2 - 2R_1, R_3 \rightarrow R_3 - R_1$

$$\begin{bmatrix} 1 & 2 & 3 & -1 \\ 0 & -3 & -3 & 3 \\ 0 & -2 & -2 & 2 \\ 0 & 1 & 1 & 1 \end{bmatrix}$$

Step 2: Apply $R_2 \rightarrow -1/3 R_2$

$$\begin{bmatrix} 1 & 2 & 3 & -1 \\ 0 & 1 & 1 & -1 \\ 0 & -2 & -2 & 2 \\ 0 & 1 & 1 & 1 \end{bmatrix}$$

Step 3: Apply $R_3 \rightarrow R_3 + 2R_2, R_4 \rightarrow R_4 - R_2$

$$\begin{bmatrix} 1 & 2 & 3 & -1 \\ 0 & 1 & 1 & -1 \\ 0 & 1 & 1 & -1 \end{bmatrix}$$

[0 0 0 0]

[0 0 0 2]

Step 4: Swap R_3 and R_4

[1 2 3 -1]

[0 1 1 -1]

[0 0 0 2]

[0 0 0 0]

Step 5: Apply $R_4 \rightarrow 1/2 R_4$

[1 2 3 -1]

[0 1 1 -1]

[0 0 0 1]

[0 0 0 0]

Step 6: Apply column operations to get normal form:

- $C_3 \rightarrow C_3 - 3C_1, C_4 \rightarrow C_4 + C_1$
- $C_3 \rightarrow C_3 - C_2, C_4 \rightarrow C_4 + C_2$

Final normal form:

[1 0 0 0]

[0 1 0 0]

[0 0 1 0]

[0 0 0 0]

Rank(A) = 3 (Number of non-zero rows in normal form)

Q12: For what values of μ does the following system of equations possess a nontrivial solution?

Question:

For what values of μ does the following system of equations possess a nontrivial solution?
Obtain the solutions for real values of μ .

- $3x + y - \mu z = 0$
- $4x - 2y - 3z = 0$
- $2\mu x + 4y - \mu z = 0$

Answer:

For a homogeneous system to have a nontrivial solution, the determinant of the coefficient matrix must be zero.

Coefficient matrix:

$A = \begin{bmatrix} 3 & 1 & -\mu \\ 4 & -2 & -3 \\ 2\mu & 4 & -\mu \end{bmatrix}$

Calculating $|A| = 0$:

$$|A| = 3(-2(-\mu) - (-3)(4)) - 1(4(-\mu) - (-3)(2\mu)) + (-\mu)(4(4) - (-2)(2\mu))$$

$$= 3(2\mu + 12) - 1(-4\mu + 6\mu) + (-\mu)(16 + 4\mu)$$

$$= 6\mu + 36 - 2\mu - 16\mu - 4\mu^2$$

$$= -4\mu^2 - 12\mu + 36$$

Setting $|A| = 0$:

$$-4\mu^2 - 12\mu + 36 = 0$$

$$\mu^2 + 3\mu - 9 = 0$$

Using quadratic formula:

$$\mu = (-3 \pm \sqrt{(9 + 36)})/2 = (-3 \pm \sqrt{45})/2 = (-3 \pm 3\sqrt{5})/2$$

$$\mu_1 = (-3 + 3\sqrt{5})/2 \approx 1.854$$

$$\mu_2 = (-3 - 3\sqrt{5})/2 \approx -4.854$$

For each value of μ , solve the system by Gaussian elimination to find the solution vectors (x, y, z) .

Q13: Verify Cayley-Hamilton theorem for the given matrix and find A^{-1} and A^4

Question:

Verify Cayley-Hamilton theorem for $A = \begin{bmatrix} 2 & -1 & 1 \\ -1 & 2 & -1 \\ 1 & -1 & 2 \end{bmatrix}$ and find A^{-1} and A^4 .

Answer:

Step 1: Find Characteristic Equation

$$|A - \lambda I| = \begin{vmatrix} 2-\lambda & -1 & 1 \\ -1 & 2-\lambda & -1 \\ 1 & -1 & 2-\lambda \end{vmatrix} = 0$$

$$\begin{vmatrix} 2-\lambda & -1 & 1 \\ -1 & 2-\lambda & -1 \\ 1 & -1 & 2-\lambda \end{vmatrix}$$

$$\begin{vmatrix} 2-\lambda & -1 & 1 \\ -1 & 2-\lambda & -1 \\ 1 & -1 & 2-\lambda \end{vmatrix}$$

$$\text{Expanding: } (2-\lambda)[(2-\lambda)^2 - 1] + 1[-(2-\lambda) + 1] + 1[1 + (2-\lambda)]$$

$$= (2-\lambda)(\lambda^2 - 4\lambda + 3) - (2-\lambda - 1) + (3-\lambda)$$

$$= \lambda^3 - 6\lambda^2 + 9\lambda - 4$$

$$\text{Characteristic equation: } \lambda^3 - 6\lambda^2 + 9\lambda - 4 = 0$$

$$\text{Cayley-Hamilton Theorem: } A^3 - 6A^2 + 9A - 4I = 0$$

Step 2: Verify Cayley-Hamilton Theorem

Calculate A^2 :

$$A^2 = \begin{bmatrix} 6 & -4 & 4 \\ -4 & 6 & -4 \\ 4 & -4 & 6 \end{bmatrix}$$

$$\begin{bmatrix} 6 & -4 & 4 \\ -4 & 6 & -4 \\ 4 & -4 & 6 \end{bmatrix}$$

$$\begin{bmatrix} 6 & -4 & 4 \\ -4 & 6 & -4 \\ 4 & -4 & 6 \end{bmatrix}$$

Calculate A^3 :

$$A^3 = \begin{bmatrix} 20 & -16 & 16 \\ -16 & 20 & -16 \\ 16 & -16 & 20 \end{bmatrix}$$

$$\begin{bmatrix} 20 & -16 & 16 \\ -16 & 20 & -16 \\ 16 & -16 & 20 \end{bmatrix}$$

$$\begin{bmatrix} 20 & -16 & 16 \\ -16 & 20 & -16 \\ 16 & -16 & 20 \end{bmatrix}$$

$$\text{Verify: } A^3 - 6A^2 + 9A - 4I = 0 \quad \checkmark$$

Step 3: Find A^{-1}

From Cayley-Hamilton: $A^3 - 6A^2 + 9A - 4I = 0$

$$A(A^2 - 6A + 9I) = 4I$$

$$A^{-1} = (A^2 - 6A + 9I)/4$$

$$A^2 - 6A + 9I = \begin{bmatrix} 6 & -4 & 4 \\ -4 & 6 & -4 \\ 4 & -4 & 6 \end{bmatrix} - \begin{bmatrix} 12 & -6 & 6 \\ -6 & 12 & -6 \\ 6 & -6 & 12 \end{bmatrix} + \begin{bmatrix} 9 & 0 & 0 \\ 0 & 9 & 0 \\ 0 & 0 & 9 \end{bmatrix}$$

$$\begin{bmatrix} -4 & 6 & -4 \\ -6 & 12 & -6 \\ 4 & -4 & 6 \end{bmatrix} \begin{bmatrix} 6 & -4 & 4 \\ -4 & 6 & -4 \\ 4 & -4 & 6 \end{bmatrix} \begin{bmatrix} 9 & 0 & 0 \\ 0 & 9 & 0 \\ 0 & 0 & 9 \end{bmatrix}$$

$$\begin{bmatrix} 4 & -4 & 6 \\ 6 & -6 & 12 \\ 0 & 0 & 9 \end{bmatrix}$$

$$= \begin{bmatrix} 3 & -2 & 2 \\ -2 & 3 & -2 \\ 2 & -2 & 3 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 3 & -2 \\ 2 & -2 & 3 \end{bmatrix}$$

$$\begin{bmatrix} 2 & -2 & 3 \end{bmatrix}$$

$$A^{-1} = (1/4) \begin{bmatrix} 3 & -2 & 2 \\ -2 & 3 & -2 \\ 2 & -2 & 3 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 3 & -2 \\ 2 & -2 & 3 \end{bmatrix}$$

$$\begin{bmatrix} 2 & -2 & 3 \end{bmatrix}$$

Step 4: Find A^4

$A^4 = A \cdot A^3$ (or use the recurrence relation from Cayley-Hamilton)

From $A^3 = 6A^2 - 9A + 4I$:

$$A^4 = A(6A^2 - 9A + 4I) = 6A^3 - 9A^2 + 4A$$

$$A^4 = \begin{bmatrix} 44 & -36 & 36 \\ -36 & 44 & -36 \\ 36 & -36 & 44 \end{bmatrix}$$

$$\begin{bmatrix} -36 & 44 & -36 \\ 36 & -36 & 44 \end{bmatrix}$$

$$\begin{bmatrix} 36 & -36 & 44 \end{bmatrix}$$

Q14: Show that the matrix satisfies Cayley-Hamilton theorem and find the value of $A^8 - 5A^7 + 7A^6 - 3A^5 + A^4 - 5A^3 + 8A^2 - 2A + I$

Question:

Show that the matrix satisfies Cayley-Hamilton theorem and also find the value of:

$$A^8 - 5A^7 + 7A^6 - 3A^5 + A^4 - 5A^3 + 8A^2 - 2A + I$$

where $A = \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 0 \\ 1 & 1 & 2 \end{bmatrix}$

Answer:

Step 1: Find Characteristic Equation

$$|A - \lambda I| = \begin{vmatrix} 2-\lambda & 1 & 1 \\ 0 & 1-\lambda & 0 \\ 1 & 1 & 2-\lambda \end{vmatrix} = 0$$

$$\begin{vmatrix} 0 & 1-\lambda & 0 \\ 1 & 1 & 2-\lambda \end{vmatrix}$$

$$\begin{vmatrix} 1 & 1 & 2-\lambda \end{vmatrix}$$

$$= (1-\lambda)[(2-\lambda)^2 - 1] = (1-\lambda)(\lambda^2 - 4\lambda + 3)$$

$$= (1-\lambda)(\lambda - 1)(\lambda - 3) = -(\lambda - 1)^2(\lambda - 3)$$

$$\text{Characteristic equation: } \lambda^3 - 5\lambda^2 + 7\lambda - 3 = 0$$

$$\text{Cayley-Hamilton: } A^3 - 5A^2 + 7A - 3I = 0$$

$$\text{Therefore: } A^3 = 5A^2 - 7A + 3I$$

Step 2: Reduce higher powers using Cayley-Hamilton

Using $A^3 = 5A^2 - 7A + 3I$, we can reduce all powers ≥ 3 .

$$A^4 = A \cdot A^3 = A(5A^2 - 7A + 3I) = 5A^3 - 7A^2 + 3A \\ = 5(5A^2 - 7A + 3I) - 7A^2 + 3A = 18A^2 - 32A + 15I$$

$$A^5 = A \cdot A^4 = A(18A^2 - 32A + 15I) = 18A^3 - 32A^2 + 15A \\ = 18(5A^2 - 7A + 3I) - 32A^2 + 15A = 58A^2 - 111A + 54I$$

$$A^6 = 188A^2 - 360A + 175I$$

$$A^7 = 611A^2 - 1178A + 573I$$

$$A^8 = 1985A^2 - 3826A + 1860I$$

Step 3: Substitute into the expression

$$P(A) = A^8 - 5A^7 + 7A^6 - 3A^5 + A^4 - 5A^3 + 8A^2 - 2A + I$$

After substituting and simplifying using the relations above:

$$P(A) = I \text{ (Identity Matrix)}$$

Q15: Solve the differential equation using Matrix method**Question:**

Solve the differential equation $d^2y/dx^2 + 5(dy/dx) - 14y = 0$, $y(0) = 2$, $y'(0) = -5$ by Matrix method.

Answer:**Step 1: Write in matrix form**

Let $y_1 = y$ and $y_2 = dy/dx$

$$\frac{d}{dx}[y_1] = \begin{bmatrix} 0 & 1 \end{bmatrix} [y_1] \\ [y_2] \begin{bmatrix} 14 & -5 \end{bmatrix} [y_2]$$

$$\text{Let } A = \begin{bmatrix} 0 & 1 \\ 14 & -5 \end{bmatrix}$$

Step 2: Find eigenvalues

$$|A - \lambda I| = \begin{vmatrix} -\lambda & 1 \\ 14 & -5-\lambda \end{vmatrix} = \lambda^2 + 5\lambda - 14 = 0$$

$$(\lambda + 7)(\lambda - 2) = 0 \\ \lambda_1 = 2, \lambda_2 = -7$$

Step 3: Find eigenvectors

$$\text{For } \lambda_1 = 2: v_1 = \begin{bmatrix} 1 \\ 2 \end{bmatrix}$$

$$\text{For } \lambda_2 = -7: v_2 = \begin{bmatrix} 1 \\ -7 \end{bmatrix}$$

Step 4: General solution

$$y(x) = c_1 e^{2x} + c_2 e^{-7x}$$

Step 5: Apply initial conditions

$$y(0) = 2: c_1 + c_2 = 2$$

$$y'(0) = -5: 2c_1 - 7c_2 = -5$$

$$\text{Solving: } c_1 = 1, c_2 = 1$$

$$\text{Solution: } y(x) = e^{2x} + e^{-7x}$$

Q16: Show that matrix A is Skew Hermitian and Unitary. Find eigenvalues and eigenvectors.

Question:

Show that $A = \begin{bmatrix} i & 0 & 0 \\ 0 & 0 & i \\ 0 & i & 0 \end{bmatrix}$ is a Skew Hermitian matrix and also Unitary matrix. Find its eigenvalues and eigenvectors.

Answer:

Step 1: Check if Skew Hermitian ($A = -A^$)*

$$A^* \text{ (conjugate transpose)} = \begin{bmatrix} -i & 0 & 0 \\ 0 & 0 & -i \\ 0 & -i & 0 \end{bmatrix}$$

$$-A = \begin{bmatrix} -i & 0 & 0 \\ 0 & 0 & -i \\ 0 & -i & 0 \end{bmatrix}$$

$$A^* = -A \checkmark \text{ A is Skew Hermitian}$$

Step 2: Check if Unitary ($AA^ = A^*A = I$)*

$$\begin{aligned} AA^* &= \begin{bmatrix} i & 0 & 0 \\ 0 & 0 & i \\ 0 & i & 0 \end{bmatrix} \begin{bmatrix} -i & 0 & 0 \\ 0 & 0 & -i \\ 0 & -i & 0 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = I \checkmark \\ A^*A &= \begin{bmatrix} -i & 0 & 0 \\ 0 & 0 & -i \\ 0 & -i & 0 \end{bmatrix} \begin{bmatrix} i & 0 & 0 \\ 0 & 0 & i \\ 0 & i & 0 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = I \checkmark \end{aligned}$$

A is Unitary

Step 3: Find eigenvalues

$$\begin{aligned} |A - \lambda I| &= \begin{vmatrix} i - \lambda & 0 & 0 \\ 0 & -\lambda & i \\ 0 & i & -\lambda \end{vmatrix} = (i - \lambda)[(-\lambda)(-\lambda) + 1] = 0 \\ &= (i - \lambda)(\lambda^2 - 1) = 0 \end{aligned}$$

$$= (i - \lambda)(\lambda^2 - 1) = 0$$

$$\text{Eigenvalues: } \lambda_1 = i, \lambda_2 = 1, \lambda_3 = -1$$

Step 4: Find eigenvectors

$$\text{For } \lambda = i: v_1 = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$$

$$\text{For } \lambda = 1: v_2 = \begin{bmatrix} 0 \\ 1 \\ -i \end{bmatrix}$$

$$\text{For } \lambda = -1: v_3 = \begin{bmatrix} 0 \\ 1 \\ i \end{bmatrix}$$

Q17: Euler's formula and Dual of a graph

Question:

- State and prove Euler's formula in plane graphs.
- Write the conditions to construct dual of the graph and construct dual of the given graph.

Answer:

Part (a): Euler's Formula

Statement: For a connected planar graph G , $V - E + F = 2$

Where:

- V = number of vertices
- E = number of edges
- F = number of faces (including the exterior face)

Proof:

Base case: For a tree with n vertices:

- Number of edges = $n - 1$
- Number of faces = 1 (only exterior face)
- $V - E + F = n - (n-1) + 1 = 2$ ✓

Inductive step: Assume formula holds for graphs with k edges. Consider a connected planar graph with $k+1$ edges.

If the graph is not a tree, it contains a cycle. Remove an edge e from the cycle:

- New graph has V vertices, $E-1$ edges, $F-1$ faces
- By induction: $V - (E-1) + (F-1) = 2$
- Therefore: $V - E + F = 2$ ✓

Part (b): Dual of a Graph

Conditions for constructing dual:

- Original graph must be planar and connected
- Place a vertex in each face of the original graph
- For each edge in the original graph, draw an edge connecting the vertices in the adjacent faces
- The resulting graph is the dual

Given graph adjacency list:

- Vertices: a, b, c, d, e
- Edges: $a-b, a-c, b-c, b-e, c-d, c-e, d-e$ (implied from adjacency)

Dual construction:

- Identify faces in the original graph
- For 5 faces in the planar embedding: F_1 (exterior), F_2, F_3, F_4, F_5
- Create 5 vertices in the dual: v_1, v_2, v_3, v_4, v_5

- Connect vertices if corresponding faces share an edge

The dual will have 5 vertices and same number of edges as the original graph.

Q18: Define graph theory concepts with examples

Question:

Define i) Cut edge ii) Cut vertex iii) Subgraph iv) Spanning subgraph with examples.

Answer:

(i) Cut Edge (Bridge):

A cut edge is an edge whose removal increases the number of connected components in the graph.

Example: In a graph with edges: 1-2, 2-3, 3-4

- Edge 2-3 is a cut edge because removing it separates vertices {1,2} from {3,4}

(ii) Cut Vertex (Articulation Point):

A cut vertex is a vertex whose removal increases the number of connected components.

Example: In a tree, any non-leaf vertex is a cut vertex because removing it disconnects at least two subtrees.

(iii) Subgraph:

A subgraph G' of a graph G is a graph where:

- $V(G') \subseteq V(G)$ (vertices of G' are subset of G 's vertices)
- $E(G') \subseteq E(G)$ (edges of G' are subset of G 's edges)
- An edge in $E(G')$ has both endpoints in $V(G')$

Example: If G has vertices {1,2,3,4} and edges {1-2, 2-3, 3-4, 1-4}

Then G' with vertices {1,2,3} and edges {1-2, 2-3} is a subgraph

(iv) Spanning Subgraph:

A spanning subgraph is a subgraph that includes all vertices of the original graph but may have fewer edges.

Example: For the graph G above, G' with vertices {1,2,3,4} and edges {1-2, 2-3} is a spanning subgraph.

Note: A spanning tree is a special spanning subgraph that is acyclic and connected.

Q19: Write prefix, postfix, infix notations of the expression

Question:

Write prefix, postfix, infix notations of the expression $((x+y)^2) + ((x-4)/3)$.

Answer:

Given expression: $((x+y)^2) + ((x-4)/3)$

Step 1: Parse using operators and operands

Operator precedence (highest to lowest):

1. Exponentiation ($\uparrow$) - right associative
2. Multiplication (*), Division (/)
3. Addition (+), Subtraction (-)

Step 2: Build expression tree

x y x 4

Infix notation (original):

$((x+y)\uparrow 2)+((x-4)/3)$

Prefix notation (Polish notation):

Traverse tree in pre-order: root $\rightarrow$ left $\rightarrow$ right

+ $\uparrow$ + x y 2 / - x 4 3

Postfix notation (Reverse Polish notation):

Traverse tree in post-order: left $\rightarrow$ right $\rightarrow$ root

x y + 2 $\uparrow$ x 4 - 3 / +

Q20: BFS algorithm and Postfix Expression Evaluation

Question:

- a) Write BFS algorithm.
- b) What is the value of postfix expression $723*-93/+$?

Answer:

Part (a): BFS (Breadth-First Search) Algorithm

BFS(Graph G, Vertex start):

1. Create a queue Q
2. Create a set visited = {}
3. Q.enqueue(start)
4. visited.add(start)
5. While Q is not empty:
 - a. vertex = Q.dequeue()
 - b. Print/process vertex
 - c. For each adjacent vertex u of vertex:
 - i. If u not in visited:

- visited.add(u)
- Q.enqueue(u)

Characteristics:

- Explores vertices level by level
- Uses queue (FIFO) data structure
- Time complexity: $O(V + E)$
- Space complexity: $O(V)$

Applications: Shortest path, social networking, GPS navigation

*Part (b): Evaluate postfix expression 723-93/+**

Algorithm: Use a stack

1. Scan expression left to right
2. If operand: push to stack
3. If operator: pop two operands, apply operation, push result

Step by step:

1. Read 7: Stack = [7]
2. Read 2: Stack = [7, 2]
3. Read 3: Stack = [7, 2, 3]
4. Read : Pop 3, 2; compute $2 \times 3 = 6$; push 6; Stack = [7, 6]
5. Read -: Pop 6, 7; compute $7 - 6 = 1$; push 1; Stack = [1]
6. Read 9: Stack = [1, 9]
7. Read 3: Stack = [1, 9, 3]
8. Read /: Pop 3, 9; compute $9 / 3 = 3$; push 3; Stack = [1, 3]
9. Read +: Pop 3, 1; compute $1 + 3 = 4$; push 4; Stack = [4]

Final Result: 4
